

WITH ENTITY CENTRAL®, CLIENTS' DATA IS SAFE AND SECURE

COGENCY GLOBAL INC. understands that the integrity of clients' entity data is critical and has made significant investments in data storage, backup and recovery plans. Our goal is to keep the important information clients need safe, secure and available.

Entity Central® is COGENCY GLOBAL's premier web-based system that allows clients to easily organize and manage entity information online. It provides corporate legal and finance departments with a convenient secure central repository to manage and control corporate compliance and transactional responsibilities.

Entity Central®'s web farm and database server are hosted in a biometrically secured collocation facility with battery and diesel-generator backup power which ensures no loss of connectivity due to power interruptions. Internet access is provided through three distinct data circuits strategically positioned to minimize the possibility of outage due to accidental cable cutting known as "backhoe fade." State-of-the-art Cisco routing and network equipment ensures near 100% Internet uptime. Facilities are climate-controlled and are further secured by state-of-the-art fire exhaustion technology.

The data in Entity Central® is maintained in a SQL database system hosted on a Dell server and disk assembly. The SQL database is replicated in real time to our off-site hot-spare location to ensure rapid-response database failover ability with no loss of data. The primary database files are stored on a RAID disk array with hot-swappable drive recovery to ensure that the database will stay available even if a physical hard drive disk fails. Full database backups are performed on a weekly basis; incremental (change-only) backups are performed nightly, and just-in-time transaction log backups are performed every thirty minutes. COGENCY GLOBAL has multiple locations where the data is actively stored using real-time replication.

Backups are archived to an off-site storage facility over 300 miles away. At this facility, archived backup files are stored on a RAID disk array for a period of no less than thirty days and are then copied to high-capacity tape. The tapes are then permanently stored off-site.

Our servers are configured with RAID drive mirroring to ensure continued uptime in the event of a physical drive failure. All servers have redundant power supplies, network connections and four-hour priority hardware support from Dell.

We guard the integrity and privacy of your confidential files. Documents uploaded to the Entity Central® Document Manager and Minute Book modules are kept in an isolated, secure storage location that even COGENCY GLOBAL representatives do not have access to, unless you grant it to them.

In summary, Entity Central® is hosted on a rock-solid hardware platform with top-tier network connections and power reliability. Built-in redundancies provide for near-immediate system failure turnaround and off-site backup storage keeps data safe and secure in the event of a major disaster. The importance we place on the security of clients' data demonstrates our ongoing commitment to provide ***"The Right Response at the Right Time, Every Time"***.
